AUTHOR: Klen, Bohdan

TITLE: The Tube RES XL and Applied Czechoslovak Patents

PERIODICAL: Sdělovací technika, 1959, Nr 12, pp 448-449

ABSTRACT: In this article the author gives a short description of the new short-wave tube Tesla RES XL and its variant RES XN and mentions the patents applied for. This tube is to be used for transmitters working in the third TV band. The RES XL tube was developed in the Vráovice Enterprise of Tesla-Rožnov by the collective of Mareš, decorated with the Order of Labor, and applied in cooperation with P. Hix, awarded the State prize. The tube is a tetrode with an idle capacity of 5kw, a self-carrying cathode and cage-shaped self-carrying grid. A schematic presentation of the tube is in Fig 1. Special attention was given to the cathode. The directly heated cathode of the tube is composed of 16 leads of thoriumized wolfram forming a cage-shaped cylindrical construction. According to

Card 1/2

CZECH/14-59-12-5/41

The Tube RES XL and Applied Czechoslovak Patents

patent Nr 90.158, each lead of the cathode is weakened on both ends so that its resistance is not equal everywhere. The other patents applied in the described tube are the following: Nr 88.940, 90.472, 92.091, 90.472, 89.318, 89.280 and 91.378. In his conclusion, the author stresses the importance of the vacuum technique for the task of catching up with the most industrially developed countries. The results achieved in this field are a proof of the ability of Czechoslovak technical personnel. There is 1 diagram and 1 photograph.

TITLE: A method of making a gas-dielectric capacitor

PERIODICAL: Referativnyy zhurnal, Elektrotehnika i energetika,  
no.11, 1962, 7, abstract 11 B53. (Czechoslovak  
Patent, 21 g, 10/01, no.98787, 15 March 1961).

TEXT: The invention relates to high-frequency gas-filled capacitors. The general construction of the capacitor and details of the fixing rods which carry the system of low-voltage plates are patented. The ends of the rods are threaded and screwed into a projection on the capacitor cover. A cylindrical nut screws directly into this projection; a second nut which maintains the system of rods in tension has a projecting head which surrounds the first nut. Longitudinal cuts are made in the head of the second nut to make it lie smoothly. A general constructional diagram of the capacitor is given, also a detailed sketch of the rod fixing. 2 figures.

7 Biochemistry of the human cornea. M. Kanski and R. Klen. *Physiol. Bohemoslov.* 3: 319-26 (1954). Chromatographic isolation of free amino acids from numerous human corneas showed that 8-16 amino acids are usually present in the free state, in the following descending order of prevalence: alanine, glutamic acid, leucine, glycine, and serine, being the most common, as determined by depth of ninhydrin color on the chromatograms. Aspartic acid is absent. Samples taken 2-3 hours after death are very low in amino acids. No difference in amino-N between stroma and epithelium was found. — O. M. Kuznetsov.

Changes in antibody titres of the ABO and Rh system. II. Evaluation of 50 cases ČSL.OPTHAL. 1955, 11/4-5 (246-249) Graphs 1 Tables 1

No anti-Rh bodies were found in 5 Rh-negative receivers onto whom a graft from Rh-positive persons was implanted. Changes of titres of antibodies of the ABO system occurred in 1/3 of operated patients when the donor had the same blood group of the ABO system; in about 1/2 of the cases, when the donor belonged to the O group; and in more than 2/3 of cases when the blood groups of both receiver and donor were incompatible.

On the basis of animal experiments, which were reported during the second conference on transplantations in Hradec Kralové (1954), the authors believe they have found in spongiosa of the growing zone of the scapula of one-year-old calves, a material which in a special way stimulates osteogenesis even in heterotransplantations. By this means the time of union may be shortened by one third to one half of that when compact heterogenous bone grafts are employed. The bone tissue was taken from the cartilagenous and bony border of the scapula. The spongiosa has a red colour and the zones from which the tissue was taken are accurately described. The transplants are particularly suitable for cases where a mechanical strength is not needed. The method was employed in man with good results, but final conclusions are still awaited.

Orig Pub: Rozhl. chirurg., 1957, 35, No 9, 616-619.

Abstract: Twenty-three Rh-negative patients were studied for the presence of Rh-antibody after they had received transplants of cornea and rib bone from the bank from Rh<sub>0</sub>-positive donors and corneas from Rh(D)-negative donors and calf bones from the bank. Rh-antibody was not detected after prolonged observation. -- A.I. Goronius.

7176. THE CHOICE OF VASCULAR GRAFTS. ARTERIO-ENDOSCOPY - Contribution au choix des greffes vasculaires. L'artério-endoscopie - Kien R. Banque des Tissus, Hôp. Clin. de Hradec Králové - LYON CHIR. 1958, 54/4 (549-554) illus. 8

The condition of the vascular endothelium is very important for the choice of a vascular graft. This can be observed only in the neighbourhood of both its ends. In the case of a long graft only a small part of the endothelial surface is visible. By means of palpation only profound changes can be recognised. Histological investigation gives only local information. This gap is filled by means of a new kind of endoscopy-arterioendoscopy. This method is described and typical pictures are shown. The author finds that arterioendoscopy is a simple and convenient examination for the choice of vascular grafts according to the condition of the endothelial surface.

TOPIC TAGS: ~~Kazakhstan geophysical~~, map, ~~geophysical map~~, tectonics, ~~geology~~  
*regional study*

ABSTRACT: On the basis of regional geophysical and geological investigations  
(seismic, gravimetric, magnetoelectric), a composite geophysical sketch map of the  
physical fields of Kazakhstan has been compiled. From this map, the major tectonic  
zones, deep structures, and geological structural zones are defined. Long zones  
representing high field gradients in the gravitational and magnetic fields reflect  
deep geosutures, which seismic sounding data suggest are scarps in the M-discontinuity.

Card 1/2

ACC NR: AT6028379

Among the major structural zones of Kazakhstan defined are: 1) the Turgayskaya, 2) the Petropavlovskaya, 3) the Uspenskaya, 4) the Tokrauskaya, and 5) the Dzhalair-Naymanskaya. Regions of magmatism are also defined. In the tectonic depression zones, contour lines indicate the thickness of the sedimentary cover, overlying the folded basement, and possible oil-bearing formations. Orig. art. has: 1 figure. (DH)

**AUTHORS:** Tsvetkov, V. N., Klenin, S. I. 57-28-5-18/36

**TITLE:** Diffusion and Viscosity of Solutions of Polymethylmetacrylate and of Polyparatertiary Butylphenylmetacrylate (Diffuziya i vyaskost' rastvorov polimetilmetakrilata i poliparatretichnogo butilfenilmetakrilata)

**PERIODICAL:** Zhurnal Tekhnicheskoy Fiziki, 1958, Vol. 28, Nr 5, pp. 1019-1028 (USSR)

**ABSTRACT:** The diffusion velocity of polymers in diluted solution represents one of the immediate characteristics of its molecular size. Therefore it is possible to pass a judgement on the structure of its macromolecules from the determination of the diffusion coefficient of the polymer in the solution. In the present paper the authors applied this method to the comparative examination of the properties of polymethylmetacrylate (PMMA) and of polyparatertiary butylphenylmetacrylate (PBPHMA). These compounds represent polymers with identical chain structure of the basic valence, however, with a different size and structure of the molecular side groups. The dependence of the characteristic viscosities $[\eta]$  and of the diffusion coefficients  $D$  on the molecular weight of the fraction was given for two

Card 1/4

Diffusion and Viscosity of Solutions of Polymethylmetacrylate 57-28-5-18/36  
and of Polyparatertiary Butylphenylmetacrylate

investigated polymers in a logarithmic scale (figures 9 and 10). These points coincide with the straight lines corresponding to the following functions. For PMMA in chloroform holds:

$$[\eta] = 5.1 \cdot 10^{-5} \cdot M^{0.79} \quad D = 4.5 \cdot 10^{-4} M^{-0.60}$$

and for PBPHMA in chloroform

$$[\eta] = 2.4 \cdot 10^{-5} M^{0.78} \quad D = 6.0 \cdot 10^{-4} M^{-0.60}$$

As is known, a universal interrelation exists between the diffusion coefficient  $D$  and the characteristic viscosity  $[\eta]$  of the polymer fraction in the corresponding solvent, (Refs 8 and 9). If the hydrodynamical properties of the molecular tangle in the solution is described by means of equivalent, semi-transparent spheres, as it is done in the theory by Debye-Bueche (Ref 13), the ratio between the hydrodynamical molecular radius from the viscosity  $R_H$  and the radius from diffusion  $R_D$  is

$$\frac{R_H}{R_D} = \frac{6\pi}{k} \left( \frac{30}{\pi N} \right)^{1/3} \left\{ \eta_0 D (M[\eta])^{-1} \right\}^{1/2} \left( \frac{2.5}{\varphi(\sigma)} \right)^{1/2}$$

Card 2/4

Hence, the quantity  $A = \eta_0 D T^{-1} (M[\eta])^{1/2}$  differs from the ratio

Diffusion and Viscosity of Solutions of Polymethylmetacrylate 57-28-5-18/36  
and of Polyparatertiary Butylphenylmetacrylate

$\frac{R_0}{R_D}$  only by the numerical multiplicand. The theory by Flory shows analogous results (Ref 14). Experiments show that the quantity  $A$  proportional to the ratio  $R_0/R_D$  represents a universal constant, its most probable value being  $A=3.44 \cdot 10^{-10}$   $\frac{cm^2}{g}$ . The proportion of the viscosity- and hydrodynamic diffusion radii permits to immediately obtain the interrelation between the size of the macromolecules and the diffusion coefficient. Summary: In this paper a device for the measurement of the diffusion coefficient in solutions is described. It is based upon the application of the polarization interferometer! The diffusion and the viscosity of the solutions of polymethylmetacrylate and of polybutylphenylmetacrylate in the wide interval of the molecular balance was investigated. A simple relation was obtained, which permits to determine the size of the macromolecules in the solution according to the measured diffusion coefficients. The experimental results permit to conclude that rotation in the chains of polybutylphenylmetacrylate is more impeded than is the case in the chains of polymethylmetacrylate. There are 13 figures, 3 tables, and 14 references, 10 of which are Soviet.

**TITLE:** Molecular conformation, and hydrodynamic and mechanical  
properties of 4:5 styrene - isoprene bulk copolymer

**PERIODICAL:** Vysekonelekulyarnyye soedineniya, v. 4, no. 2, 1962, 250-255

**TEXT:** The authors studied the hydrodynamic and mechanical properties of hybrid polymers on the basis of the selective solubility of one type of blocks in the corresponding solvent to make a quantitative estimate of the conformation changes of macromolecules dependent on the solvent, and to measure the mechanical properties of the resulting films. They investigated 4:5 styrene - isoprene bulk copolymer (BCSI) made with butyl lithium and consisting of four polystyrene (PS) and five polyisoprene (PI) blocks. The molecular weight determined in methyl ethyl ketone was  $M = 77,000$ , that of PS:  $M = 10,000$ , that of PI:  $M = 7500$ . Solvents used were: benzene, toluene, heptane, octane, and methyl ethyl ketone. 0.1 mm thick films were obtained from 1 g/100 ml of solutions in heptane

Card 1/4

B110/B101

and methyl ethyl ketone on Hg surface at 25°C and 20 mm Hg. The diffusion coefficients were determined at 0.05% concentration by a Tsvetkov diffusometer. The sedimentation coefficients were determined by a Svedberg ultracentrifuge. The molecular weight was calculated according to Svedberg:  $M = (SRT)/[D(1-\bar{v}_0)]$  (2), and Flory and Mandel'kern,  $2.5 \cdot 10^6 = [\eta N / (1-\bar{v}_0)] [s(l\eta)/M^2]^{1/3}$  (3), where  $N$  - Avogadro's number;  $\rho$  - density, and  $\eta$  - viscosity of the solvent. (3) presupposes conformation of statistical nodes of macromolecules, the linear dimensions being proportional to  $M^{1/2+\epsilon}$  ( $\epsilon$  - small parameter). The coincidence of different mean weights in different solvents indicates weak polydispersity. The absence of a relation between  $M_w$  and  $M_{sp}$  and the mean hydrodynamic weights  $M_{eq}$  and  $M_{Df}$  demonstrates the unsuitability of the model of statistical nodes. The PI blocks keep the octane-insoluble PS blocks in solution. Therefore, they form small pearls threaded on the polyisoprene string. In methyl ethyl ketone, it is vice versa. Flory's theory does not apply to this case. There is no relationship between "viscous" and

Card 2/4

Molecular conformation, and...

"diffusion" inertia radii for selective solvents, It follows that, in these solvents, the molecules are converted from statistical nodes into half-stiff particles, to which Fig. 26, ~~4~~ does not apply but Fig. 21 according to Schlick and Levy (see below). Films obtained from octane, heptane, and hexane solutions of PCSI with evaporation of the solvent are rubberlike, nontransparent, and highly elastic. Films from methyl ethyl ketone remind of plasticized PS. Films (A) obtained from heptane would resume their old shape when the loading ends, the more solid films (B) from methyl ethyl ketone to a smaller extent. (A) has:  $E \approx 10 \text{ kg/cm}^2$

like rubber. (B) has  $E \approx 200 \text{ kg/cm}^2$ . Films from benzene are mechanically similar to (B). Blocks with globules "remember" their conformation on transition into the film (A) may be regarded as polyisoprene with chemically bound, glassy filler, (B) as PS with chemically bound plasticizer. "Tempering" occurs during film formation; during "annealing", the globules develop, and the properties of the film correspond to those of film obtained from benzene. There are 3 figures, 2 tables, and 9 references: 7 Soviet and 2 non-Soviet. The two references to English-language publications read as follows: F. M. Merrett, *J. Polymer. Sci.*, 24, 467, 1957. S. Schlick, M. Levy, *J. Phys. Chem.*, 64, 883, 1960.

TITLE:

Hydrodynamic properties of poly-β-vinyl naphthalene macromolecules in benzene

PERIODICAL:

Vysokomolekulyarnyye soyedineniya, v. 4, no. 4, 1962, 540-545

TEXT: Diffusion constants, sedimentation coefficients and intrinsic viscosity of 10 fractions of poly-β-vinyl naphthalene (P-β-VN) in benzene were studied. The Mark - Kuhn - Houwink relations in this solvent were found to have the form  $D = 3.5 \cdot 10^{-4} \cdot M_{S,D}^{-0.57}$  for the diffusion coefficient, and  $[\eta] = 6.6 \cdot 10^{-5} \cdot M_{S,D}^{0.71}$  for the intrinsic viscosity. The molecular weight  $M_{S,D}$  was determined from Svedberg's equation. The hydrodynamic behavior of P-β-VN, which is determined by viscosity and diffusion, is completely normal and confirms the universal character of the empirical constant  $A = \eta_0 D (M[\eta])^{1/3} T^{-1}$ . It's mean value was  $(3.1 \pm 0.1) \cdot 10^{-10}$  erg/degree. This Card 1/3

S/190/62/004/004/010/019  
B117/B138

Hydrodynamic properties of ...

corresponded to the value of this constant determined for other polymers and again confirmed the usual correlation of hydrodynamic properties of P-β-VN during translation and rotation. The estimate of the relation between dimensions of P-β-VN molecules in benzene and their dimensions during free

rotation  $(\bar{h}^2)_0^{1/2} / (\bar{h}^2)_f^{1/2}$ , which characterizes the hardness of the molecular

structure, made by means of the previously determined swelling parameter (Ref. 9: V. Ye. Eskin, K. Z. Korotkina, Vysokomolek. soyed., 2, 272, 1960)

$\alpha^3 = ([\eta] / [\eta]_0) = 1.2$ , produced a mean value of 2.6.  $((\bar{h}^2)_0^{1/2} / (\bar{h}^2)_D^{1/2})^\alpha$

are undisturbed dimensions of the macromolecule). This amount, which slightly exceeds the corresponding values for most of the linear polymers, showed (e. g. in comparison with polystyrene) that the substitution of the benzene ring by naphthalene increases the thermodynamic hardness of the macromolecule. It was found that the dependence of the diffusion coefficient D on the concentration of one of the P-β-VN fractions with  $M = 3.5 \cdot 10^6$  is only slight in CCl<sub>4</sub> and more marked in benzene. This confirms that the

dependence on the concentration is mainly determined by the thermodynamic interaction between polymer and solvent. (Ref. 13: V. N. Tsvetkov, S. I. Card 2/3

TITLE: Synthesis of graft copolymers. II. Dimensions, configuration, and optical properties of the macromolecules of the graft methyl methacrylate - styrene copolymer

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 5, no. 1, 1963, 3 - 10

TEXT: Polystyrene of molecular weight  $\approx 2 \cdot 10^3$  was grafted on polymethyl methacrylate, molecular weight  $7 \cdot 10^4$ . Refractometric examination of the copolymer composition showed the molar part of polystyrene to be 0.9. The average-weight molecular weight of  $\approx (0.5 - 0.6) \cdot 10^6$  was determined by light scattering. Analysis of the diffusion curve proved the content of the low-molecular components to be no more than 5-10%. The optical anisotropy of the copolymer was determined by flow birefringence in bromoform. According to W. Kuhn and H. Kuhn. (Helv. chim. acta, 26, 1394, 1943; 28, 1553, 1945);  $870 \cdot 10^{-25} \text{cm}^3$  is found for the difference  $(\alpha_1 - \alpha_2)$  in main

Card 1/2

Synthesis of graft copolymers. II. ... S/190/63/005/001/001/020  
B101/B186

polarization capacities of one macromolecular segment of the copolymer; for polymethyl methacrylate, this value is  $(2 - 20) \cdot 10^{-25} \text{cm}^3$ , and for polystyrene it is  $-(140 - 200) \cdot 10^{-25} \text{cm}^3$ . Based on Kuhn's theory, the theoretical calculation of the anisotropy of one segment of the principal methyl methacrylate chain with short graft polystyrene chains, proved that  $(\alpha_1 - \alpha_2)$  is  $+220 \cdot 10^{-25} \text{cm}^3$ , when the polystyrene polymerization coefficient is 40 and when the molar part of polystyrene is 0.9. The experimental value, which is four times as high, is explained by the fact that the chain stiffness of the graft copolymer is higher than that of homopolymers. Conclusion: The optical anisotropy of a branched polymer may differ considerably from the anisotropy of its components. There are 5 figures and 1 table. X

TITLE: Hydrodynamic properties of polycarbethoxyphenylmethacrylamides. III B

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 6, no. 8, 1964, 1420-1425

TOPIC TAGS: macromolecular chemistry, hydrodynamics, amide

ABSTRACT: Previous investigations of one of the authors Frenkel' revealed anomalies in the hydrodynamic behavior of p-polycarbethoxyphenylmethacrylamide in such solvents as ethyl acetate and methylformamide, which were explained at that time by the development of structural rigidity in the macromolecules of this compound, giving rise to the possibility of the formation of intrachain hydrogen bonds between the amide groups or amide hydrogen and the carbonyl oxygen of the carbethoxy group. In the light of later studies indicating the impossibility of the formation of helical macromolecules, a new study was made of this compound, using four different methods: sedimentation, diffusion, viscosimetry, and light scattering. Measurements of the sedimentation, diffusion, and intrinsic viscosity in dimethylformamide and ethyl acetate confirmed the anomaly of.

the hydrodynamic properties of p-polycarbethoxyphenylmethacrylamide in these solvents, manifested in deviations from the classical ratios between the hydrodynamic characteristics and the molecular weight. The authors explain the anomaly by a progressive increase in the structural rigidity of the macromolecules with increasing molecular weight above a certain critical value  $M$  (of the order of  $10^6$ ), as a result of the formation of a system of intrachain hydrogen bonds, producing a semirigid model with internal loops and macrocycles. Consecutive addition of completed external macrocycles is manifested in the tendency toward increasing asymmetry of the coils with increasing molecular weight. Below the critical molecular weight, corresponding to incomplete macrocyclic configurations, pronounced polydispersion of the shape is manifested, leading to a discrepancy between the average molecular weights determined by different methods, while above the critical value, asymmetric configurations predominate, with a corresponding anomalous increase in the hydrodynamic interactions. In "active" solvents, competing with the polymer for hydrogen bonds, or in o-polycarbethoxyphenylmethacrylamide, where there are no intrachain hydrogen bonds, the anomaly of the hydrodynamic properties disappears. The results of this study are compared with the data of other authors, and the discrepancies are shown to be only apparent. Orig. art. has: 3 formulas, 3 graphs, 1 table.
